	Assert	Fail	17:05:09.516	Object is not found: Home		
	What happened: Object is not found: Home					
	Why: Object is not available on screen or Location property of the object is invalid.					
	Next step: If there is a load delay before the application displays the object try to slow down test execution . To check that Location of the object is valid Flash it.

AI

About Event

After this workshop, you can hand the test writing you do by hand to an AI agent and get back work you would be willing to merge.

Four hours, live, in a small group, on your own machine.

Why this skill, now

The new AI job titles ask for the same Playwright or Selenium, CI, and debugging you already know, with one line added about AI tooling. AI is not replacing test automation engineers. Engineers who use it are replacing engineers who do not.

Why live and not a recording

These tools change every few weeks, so a course recorded today is missing things three months later. Live is how I teach what is current, including what I worked out on my own project last month. My recorded courses cover the fundamentals; this covers the part that keeps moving. And when a run fails on your machine, we work out why together.

Who this is for

- You already write automated tests, or you review them
- You have used AI in a chat window, but never let an agent work inside a real project
- You want to try it on real code before you try it at work

The examples are Playwright, but the skill is directing the agent, so any framework is fine. If you have not written tests before, start with my courses and come to a later cohort.
